

ServiceNow Development with Flow Designer

Project Documentation format

1. Introduction

- **Project Title:** Auto Ticket Classification using Flow Designer
- **Team Members:**
Anand G – Team Lead
Hiruthick T.V
Hariharasudhan.M
Aswin Balaji .M
Dharani dharan .M

2. Project Overview

- **Purpose:** Automatically classify school IT support tickets. When a new Incident Workflow record is created, the flow checks the Short Description, assigns the Category and Subcategory, and emails the Caller a confirmation. This reduces manual classification and gives consistent ticket classification.
- **Features:** Flow “Auto Classify School IT Tickets” (Global application); Trigger: Record Created on Incident Workflow with Category is Empty; If / Else If classification on Short Description (Wi-Fi/Network, Projector, Forgot password, Slow Computer); Update Record for Category and Subcategory; Send Email to the Caller.

3. Architecture

- **Frontend:** No custom frontend. The flow is built in the ServiceNow Flow Designer builder and tickets are created through the standard ServiceNow interface.
- **Backend:** The Flow runs on the ServiceNow platform: Trigger (Record Created) → Condition (Category is Empty) → If / Else If on Short Description → Update Record → Send Email.
- **Database:** The ServiceNow Incident Workflow table. Fields used: Short Description, Category, Subcategory and Caller. No external database is used.

4. Setup Instructions

- **Prerequisites:** A ServiceNow Personal Developer Instance (PDI) with access to Flow Designer and the Global application. No external software dependencies.
- **Installation:** Step-by-step setup in Flow Designer:
- A new PDI was created after the previous one was terminated. [Done]
- Open Flow Designer and create the flow “Auto Classify School IT Tickets” in the Global application. [Done]
- Click Build Flow to open the builder. [Done]
- Configure the Record Created trigger: Table Incident Workflow, Condition Category is Empty. [Done]
- Add the If / Else If branches with Update Record actions for Wi-Fi/Network, Projector, Forgot Password, and Slow Computer classification. [Done]
- Add the Send Email action with the recipient set to Caller > Email. [Done]
- Activate the flow in Flow Designer.

5. Folder Structure

- **Client:** Not applicable — no client application is developed.
- **Server:** Not applicable — no server code. The flow is stored on the instance and is organised as: Flow “Auto Classify School IT Tickets” → Trigger → If / Else If (4 conditions) → Update Record → Send Email.

6. Running the Application

- The flow runs on the ServiceNow instance once activated; there are no local servers to start.
 - **Activate:** click Activate in Flow Designer.
 - **Run:** create a new Incident Workflow record with a matching Short Description and empty Category. [Done]

7. API Documentation

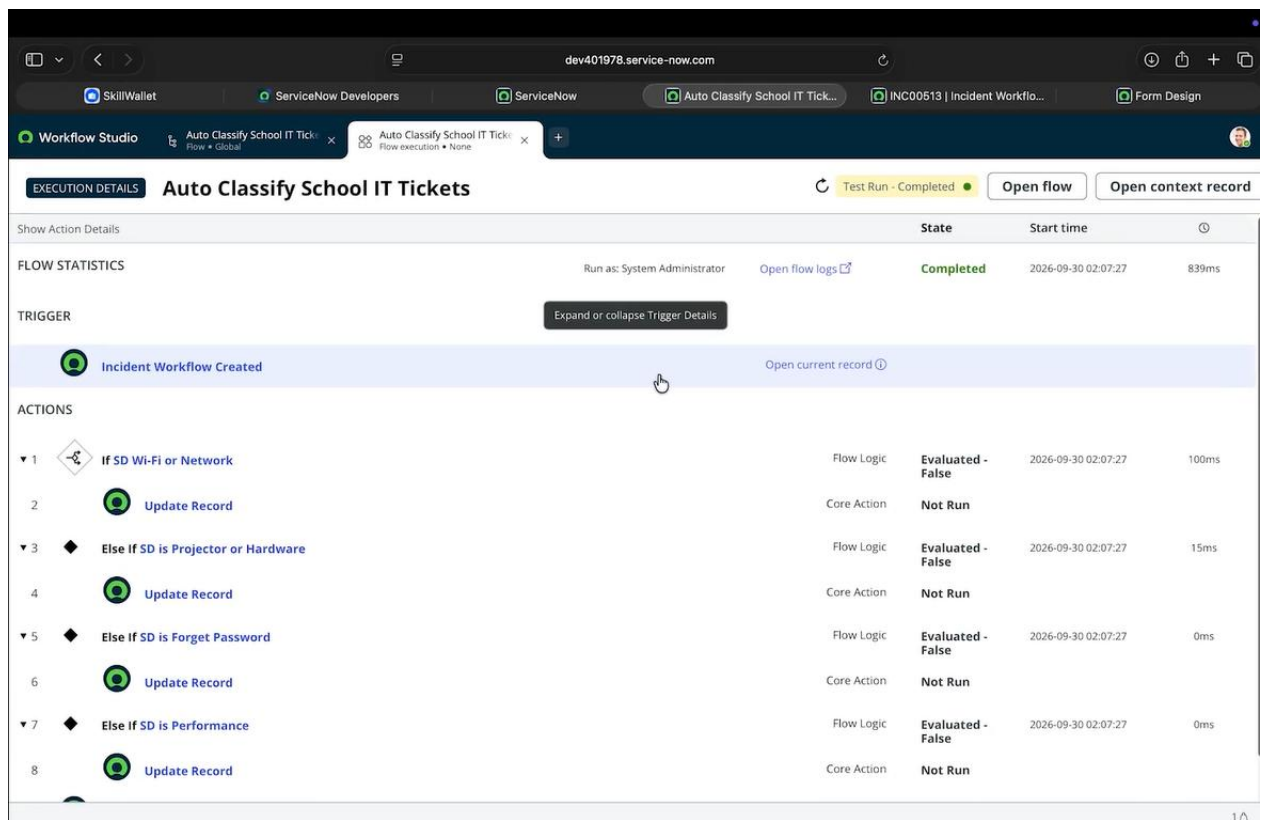

- Not applicable — no external APIs are used and no custom endpoints are exposed.

8. Authentication

- **Sign-in and access control are handled by the ServiceNow instance. No custom authentication, tokens or sessions are implemented.**

9. User Interface

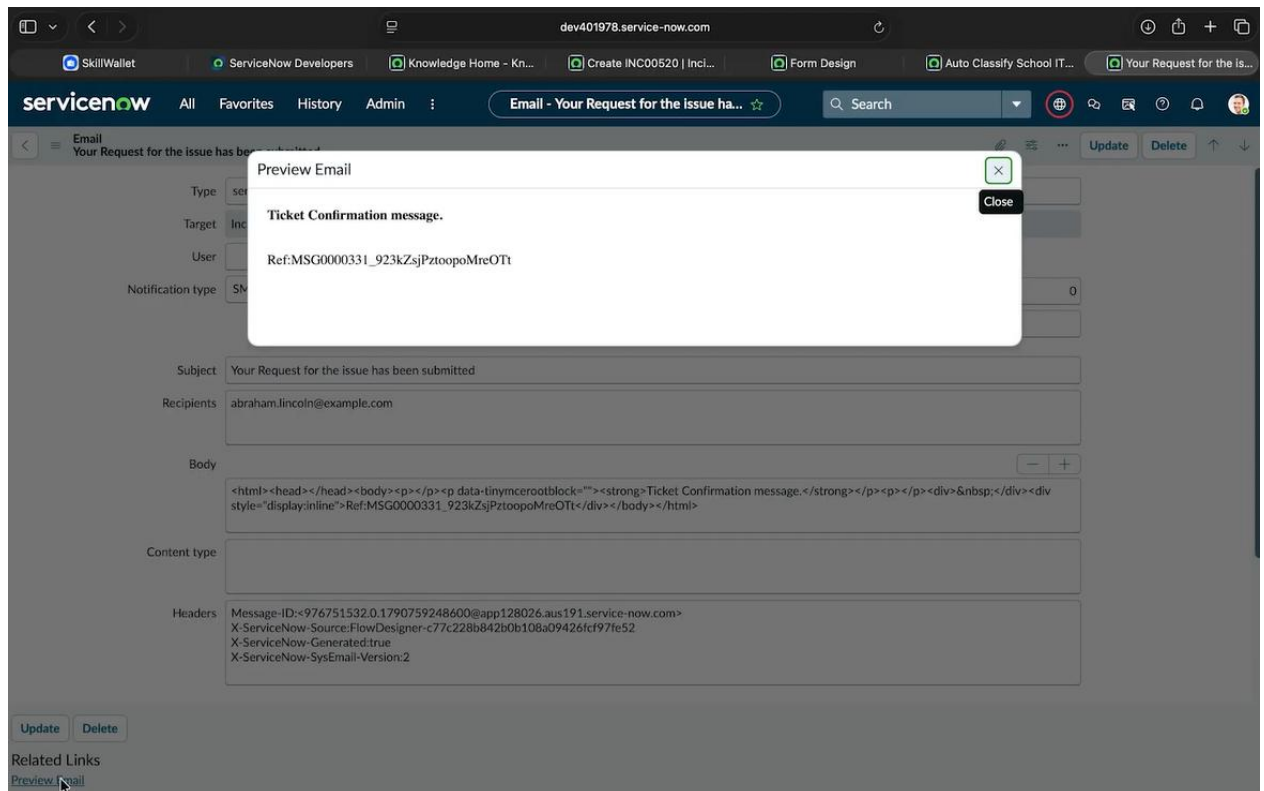

- Flow Designer builder with the trigger and branches

The screenshot displays the ServiceNow Flow Designer interface for the 'Auto Classify School IT Tickets' flow. The flow is shown in the 'EXECUTION DETAILS' view, indicating it is 'Completed'. The flow statistics show it was run as 'System Administrator' on '2026-09-30 02:07:27' with a duration of '839ms'. The trigger is 'Incident Workflow Created'. The actions are listed in a table below.

Step	Action	Flow Logic	State	Start time	Duration
1	If SD Wi-Fi or Network	Flow Logic	Evaluated - False	2026-09-30 02:07:27	100ms
2	Update Record	Core Action	Not Run		
3	Else If SD is Projector or Hardware	Flow Logic	Evaluated - False	2026-09-30 02:07:27	15ms
4	Update Record	Core Action	Not Run		
5	Else If SD is Forget Password	Flow Logic	Evaluated - False	2026-09-30 02:07:27	0ms
6	Update Record	Core Action	Not Run		
7	Else If SD is Performance	Flow Logic	Evaluated - False	2026-09-30 02:07:27	0ms
8	Update Record	Core Action	Not Run		

- Incident email confirmation record form

10. 10. Testing

- **Planned strategy:** Create test records whose Short Description contains “Wi-Fi” “Network”, “Projector”, “Forgot password” and “Slow Computer”, and check the Category, Subcategory and the email sent to the Caller.

- **Tool:** ServiceNow Flow Designer.

- **Current Status:** Flow configuration and email notification were verified. Automatic classification testing is pending.

11. Screenshots or Demo

- Screenshots: Figure 1 shows the Auto Classify School IT Tickets Flow in ServiceNow Flow Designer. Figure 2 shows the ticket confirmation email generated by the Flow.

- Project Demo Video:

https://drive.google.com/drive/folders/1QfSKbrFs2J8XZQ28GPAPtHNW_UgA4OnV

12. Known Issues

- None recorded yet. The previous PDI was terminated, so the work was restarted on a new PDI.

13. Future Enhancements

- Additional ticket types could be added by extending the If / Else If branches.
